1 Thermal states

By Anders J. E. Bjerrum (QPIT)

Prerequisites: Completeness relations A displaced oscillator thermal state ρ_{th} is given by,

$$\rho_{\rm th} = (1 - e^{-k}) D(z) e^{-ka^{\dagger}a} D(-z),$$

where k is a real positive number, given as the ratio of the oscillator energy over the thermal energy. z is a complex number referred to as the displacement of the state.

1.0.1 a)

We now show that the characteristic function of the thermal state is,

$$\chi_{\mathrm{Th}}(\alpha,\alpha^*) = \exp\left[-\frac{1}{2} \left(\begin{array}{cc} \alpha & \alpha^* \end{array}\right) \frac{1}{2} \left(\begin{array}{cc} 0 & \nu \\ \nu & 0 \end{array}\right) \left(\begin{array}{cc} \alpha \\ \alpha^* \end{array}\right) - \left(\begin{array}{cc} z & z^* \end{array}\right) \left(\begin{array}{cc} 0 & 1 \\ -1 & 0 \end{array}\right) \left(\begin{array}{cc} \alpha \\ \alpha^* \end{array}\right)\right],$$

where

$$\nu = \frac{1 + e^{-k}}{1 - e^{-k}}.$$

I) Show that we have the identity,

$$\chi_{\rm Th}(\alpha, \alpha^*) = \text{Tr} \left\{ \rho_{\rm th} D(\alpha) \right\}$$
$$= \left(1 - e^{-k} \right) e^{\alpha z^* - \alpha^* z} \text{Tr} \left\{ e^{-ka^{\dagger} a} D(\alpha) \right\}$$

II) Perform the trace in the coherent basis and show that,

$$\chi_{\rm Th}(\alpha, \alpha^*) = \frac{\left(1 - e^{-k}\right)}{\pi} e^{\alpha z^* - \alpha^* z} \int_{\mathbb{C}} d^2\beta \langle 0| e^{-ka^{\dagger}a} e^{ka^{\dagger}a} D(-\beta) e^{-ka^{\dagger}a} D(\alpha) D(\beta) |0\rangle$$

III) Verify that,

$$\langle 0|e^{-ka^{\dagger}a}=\langle 0|,$$

and

$$\begin{split} e^{ka^{\dagger}a}D(-\beta)e^{-ka^{\dagger}a} &= e^{-\beta e^k a^{\dagger} + \beta^* e^{-k}a} \\ &= e^{-\frac{1}{2}|\beta|^2}e^{-\beta e^k a^{\dagger}}e^{\beta^* e^{-k}a}. \end{split}$$

Hint: Use the Baker-Campbell-Hausdorff lemma. https://en.wikipedia.org/wiki/Baker%E2%80%93Campbell%E2%80%93Hausdorff formula

IV) Show that we can rearrange to obtain,

$$\chi_{\mathrm{Th}}(\alpha,\alpha^*) = \frac{\left(1 - e^{-k}\right)}{\pi} e^{\alpha z^* - \alpha^* z} \int_{\mathbb{C}} d^2\beta e^{-\frac{1}{2}|\beta|^2} e^{\beta^* e^{-k}(\alpha + \beta)} \langle 0|D(\alpha)D(\beta)|0\rangle$$

V) Once we have evaluated $\langle 0|D(\alpha)D(\beta)|0\rangle$ we can perform the integration over β . Perform the integral and show that,

$$\chi_{\mathrm{Th}}(\alpha,\alpha^*) = \exp\left[-\frac{1}{2} \left(\begin{array}{cc} \alpha & \alpha^* \end{array}\right) \left(\begin{array}{cc} 0 & \frac{1}{2}\nu \\ \frac{1}{2}\nu & 0 \end{array}\right) \left(\begin{array}{cc} \alpha \\ \alpha^* \end{array}\right) - \left(\begin{array}{cc} z & z^* \end{array}\right) \left(\begin{array}{cc} 0 & 1 \\ -1 & 0 \end{array}\right) \left(\begin{array}{cc} \alpha \\ \alpha^* \end{array}\right)\right]$$

Verify that the limit of $k\to\infty$ yields the characteristic function of the displaced vacuum state.

Hint: Use the formula for gaussian integrals,

 $https://en.wikipedia.org/wiki/Common_integrals_in_quantum_field_theory$

1.0.2 b)

We calculate the displacement and covariance matrix of a thermal state. We define the notation,

$$C_{\alpha} = \begin{pmatrix} \alpha \\ \alpha^* \end{pmatrix}, C_a = \begin{pmatrix} a \\ a^{\dagger} \end{pmatrix},$$
$$\bar{C} = \begin{pmatrix} z \\ z^* \end{pmatrix}, \Omega = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}.$$

We define the covariance matrix,

$$\Sigma = \frac{1}{2} \operatorname{Tr} \left\{ \rho \left(C_a \otimes C_a^T + C_a^T \otimes C_a \right) \right\} - \operatorname{Tr} \left\{ \rho C_a^T \right\} \otimes \operatorname{Tr} \left\{ \rho C_a \right\}$$
$$= \frac{1}{2} \operatorname{Tr} \left\{ \rho \left[\begin{pmatrix} aa, & aa^{\dagger} \\ a^{\dagger}a, & a^{\dagger}a^{\dagger} \end{pmatrix} + \begin{pmatrix} aa, & a^{\dagger}a \\ aa^{\dagger}, & a^{\dagger}a^{\dagger} \end{pmatrix} \right] \right\} - \begin{pmatrix} \langle a \rangle \langle a \rangle, & \langle a^{\dagger} \rangle \langle a \rangle \\ \langle a \rangle \langle a^{\dagger} \rangle, & \langle a^{\dagger} \rangle \langle a^{\dagger} \rangle \end{pmatrix}$$

where $\langle a \rangle = \text{Tr} \{ \rho a \}$ and the action of taking the expectation is elementwise over an operator matrix. The \otimes is a Kronecker product, see

 $https://en.wikipedia.org/wiki/Kronecker_product$.

Note that the commutator on $[a, a^{\dagger}] = 1$ implies,

$$C_a \otimes C_a^T - C_a^T \otimes C_a = \Omega$$

and so

$$\Sigma = \operatorname{Tr}\left\{\rho C_a^T \otimes C_a\right\} + \frac{1}{2}\Omega - \operatorname{Tr}\left\{\rho C_a^T\right\} \otimes \operatorname{Tr}\left\{\rho C_a\right\}$$

I) Show that we have the displacement,

$$\operatorname{Tr}\left\{\rho_{\operatorname{Th}}C_a\right\} = \bar{C}$$

II) Show that the covariance matrix of the single mode thermal state is,

$$\Sigma_{\mathrm{Th}} = \mathrm{Tr} \left\{ \rho_{\mathrm{Th}} C_a^T \otimes C_a \right\} + \frac{1}{2} \Omega - \mathrm{Tr} \left\{ \rho_{\mathrm{Th}} C_a^T \right\} \otimes \mathrm{Tr} \left\{ \rho_{\mathrm{Th}} C_a \right\} = \frac{1}{2} \begin{pmatrix} 0 & \nu \\ \nu & 0 \end{pmatrix}$$

1.0.3 c)

We generalize the results of a) and b) to the n-mode case. We update our notation to,

$$\alpha = \begin{pmatrix} \alpha_1 & \alpha_2 & \cdots & \alpha_n \end{pmatrix}^T, a = \begin{pmatrix} a_1 & a_2 & \cdots & a_n \end{pmatrix}^T,$$

$$z = \begin{pmatrix} z_1 & z_2 & \cdots & z_n \end{pmatrix}^T, \Omega = \begin{pmatrix} 0 & I \\ -I & 0 \end{pmatrix},$$

$$\Omega\Omega = \Omega^T \Omega^T = -I, \Omega^T = -\Omega.$$

Note that we allow the dimension of the identity matrix I to vary with context.

We have the n-mode covariance matrix,

$$\Sigma = \frac{1}{2} \operatorname{Tr} \left\{ \rho \left(C_a \otimes C_a^T + C_a^T \otimes C_a \right) \right\} - \operatorname{Tr} \left\{ \rho C_a^T \right\} \otimes \operatorname{Tr} \left\{ \rho C_a \right\},$$

which we write in block form as,

$$\Sigma = \begin{pmatrix} \Sigma_{11} & \Sigma_{12} \\ \Sigma_{21} & \Sigma_{22} \end{pmatrix} = \frac{1}{2} \text{Tr} \left\{ \rho \left[\begin{pmatrix} a \otimes a^T, & a \otimes a^{\dagger T} \\ a^{\dagger} \otimes a^T, & a^{\dagger} \otimes a^{\dagger T} \end{pmatrix} + \begin{pmatrix} a^T \otimes a, & a^{\dagger T} \otimes a \\ a^T \otimes a^{\dagger}, & a^{\dagger T} \otimes a^{\dagger} \end{pmatrix} \right] \right\} \\ - \begin{pmatrix} \langle a \rangle^T \otimes \langle a \rangle, & \langle a \rangle^{*T} \otimes \langle a \rangle \\ \langle a \rangle^T \otimes \langle a \rangle^*, & \langle a \rangle^{*T} \otimes \langle a \rangle^* \end{pmatrix},$$

where

$$\operatorname{Tr} \{ \rho a \} = \langle a \rangle$$
$$\operatorname{Tr} \{ \rho a^{\dagger} \} = \langle a^{\dagger} \rangle = \langle a \rangle^{*}$$

We now state some properties of these blocks.

I) Argue that we have the relations,

$$\begin{split} \Sigma_{11} &= \Sigma_{11}^T \\ \Sigma_{22} &= \Sigma_{22}^T \\ \Sigma_{12} &= \Sigma_{21}^T \\ \Sigma_{12}^T &= \Sigma_{12}^* \\ \Sigma_{11}^T &= \Sigma_{22} \\ \Sigma_{22}^* &= \Sigma_{11}. \end{split}$$

II) Argue that the identities from cI) jointly imply that Σ can be written in block matrix form,

$$\Sigma = \left(\begin{array}{cc} \Sigma_D & \Sigma_A \\ \Sigma_A^* & \Sigma_D^* \end{array}\right)$$

each block of dimension n.

III) Verify that we can conjugate as,

$$X\Sigma X = \Sigma^*$$

where

$$X = \left(\begin{array}{cc} 0 & I \\ I & 0 \end{array}\right)$$

1.0.4 d)

Verify that the covariance matrix Σ_{Th} of an n-mode thermal state can be written as

$$\Sigma_{\rm Th} = \frac{1}{2} \begin{pmatrix} 0 & \nu_{\rm th} \\ \nu_{\rm th} & 0 \end{pmatrix},$$

$$\nu_{\rm th} = \begin{pmatrix} \nu_1 & 0 & 0 & 0 \\ 0 & \nu_2 & 0 & 0 \\ 0 & 0 & \ddots & 0 \\ 0 & 0 & 0 & \nu_n \end{pmatrix},$$

and
$$\nu_i = \frac{1 + e^{-k_i}}{1 - e^{-k_i}}$$
.

1.0.5 e

Argue that the characteristic function of an n-mode thermal state can be written as,

$$\chi_{\mathrm{Th}}(C_{\alpha}) = \exp\left[-\frac{1}{2}C_{\alpha}^{T}\Sigma_{\mathrm{Th}}C_{\alpha} - \bar{C}^{T}\Omega C_{\alpha}\right]$$

where \bar{C} is the *n*-mode displacement $\bar{C} = \text{Tr} \{ \rho_{\text{Th}} C_a \}$, and Σ_{Th} is the thermal state covariance matrix.

1.0.6 f)

For reasons that will later become apparent, it is advantageous to symmetrize $\chi_{\mathrm{Th}}(C_{\alpha})$ a bit further. Show that $\chi_{\mathrm{Th}}(C_{\alpha})$ can be written as,

$$\chi_{\mathrm{Th}}(C_{\alpha}) = \exp\left[\frac{1}{2} \left(\Omega C_{\alpha}\right)^{T} \Sigma_{\mathrm{Th}} \Omega C_{\alpha} - \bar{C}^{T} \Omega C_{\alpha}\right]$$
